Insect migration may involve movements over multiple breeding generations at continental scales, resulting in formidable challenges to their conservation and management. Using distribution models generated from citizen scientist occurrence data and stable-carbon and -hydrogen isotope measurements, we tracked multi-generational colonization of the breeding grounds of monarch butterflies (*Danaus plexippus*) in eastern North America. We found that monarch breeding occurrence was best modelled with geographical and climatic variables resulting in an annual breeding distribution of greater than 12 million km² that encompassed 99% occurrence probability. Combining occurrence models with stable isotope measurements to estimate natal origin, we show that butterflies which overwintered in Mexico came from a wide breeding distribution, including southern portions of the range. There was a clear northward progression of monarchs over successive generations from May until August when reproductive butterflies began to change direction and moved south. Fifth-generation individuals breeding in Texas in the late summer/autumn tended to originate from northern breeding areas rather than regions further south. Although the Midwest was the most productive area during the breeding season, monarchs that re-colonized the Midwest were produced largely in Texas, suggesting that conserving breeding habitat in the Midwest alone is insufficient to ensure long-term persistence of the monarch butterfly population in eastern North America.

Abstract

OPEN ACCESS

Citation: Leemann A, Kolly M-J, Purves R, Britain D, Glaser E (2016) Crowdsourcing Language Change with Smartphone Applications. PLoS ONE 11(1): e0143060. doi:10.1371/journal.pone.0143060

Crowdsourcing linguistic phenomena with smartphone applications is relatively new. In linguistics, apps have predominantly been developed to create pronunciation dictionaries, to train acoustic models, and to archive endangered languages. This paper presents the first account of how apps can be used to collect data suitable for documenting language change: we created an app, Dialäkt Äpp (DÄ), which predicts users' dialects. For 16 linguistic variables, users select a dialectal variant from a drop-down menu. DÄ then geographically locates the user's dialect by suggesting a list of communes where dialect variants most similar to their choices are used. Underlying this prediction are 16 maps from the historical Linguistic Atlas of German-speaking Switzerland, which documents the linguistic situation around 1950. Where users disagree with the prediction, they can indicate what they consider to be their dialect's location. With this information, the 16 variables can be assessed

Circular Economy: Commission sets new rules on single-use plastics to reduce marine litter

Brussels, 27 March 2019

The European Parliament today agreed on the ambitious measures proposed by the Commission to tackle marine litter coming from the 10 single-use plastic products most often found on European beaches, as well as abandoned fishing gear and oxo-degradable plastics.

EU rules on **Single-Use Plastics** items and fishing gear, addressing the ten most found items on EU beaches, are at the forefront of the global fight against marine litter. They are part of the EU's comprehensive strategy in the world adopting a material-specific lifecycle approach to plastic waste. The Directive adopted by the European Parliament as part of the **Circular Economy Action Plan** as it stimulates the market for recycling.

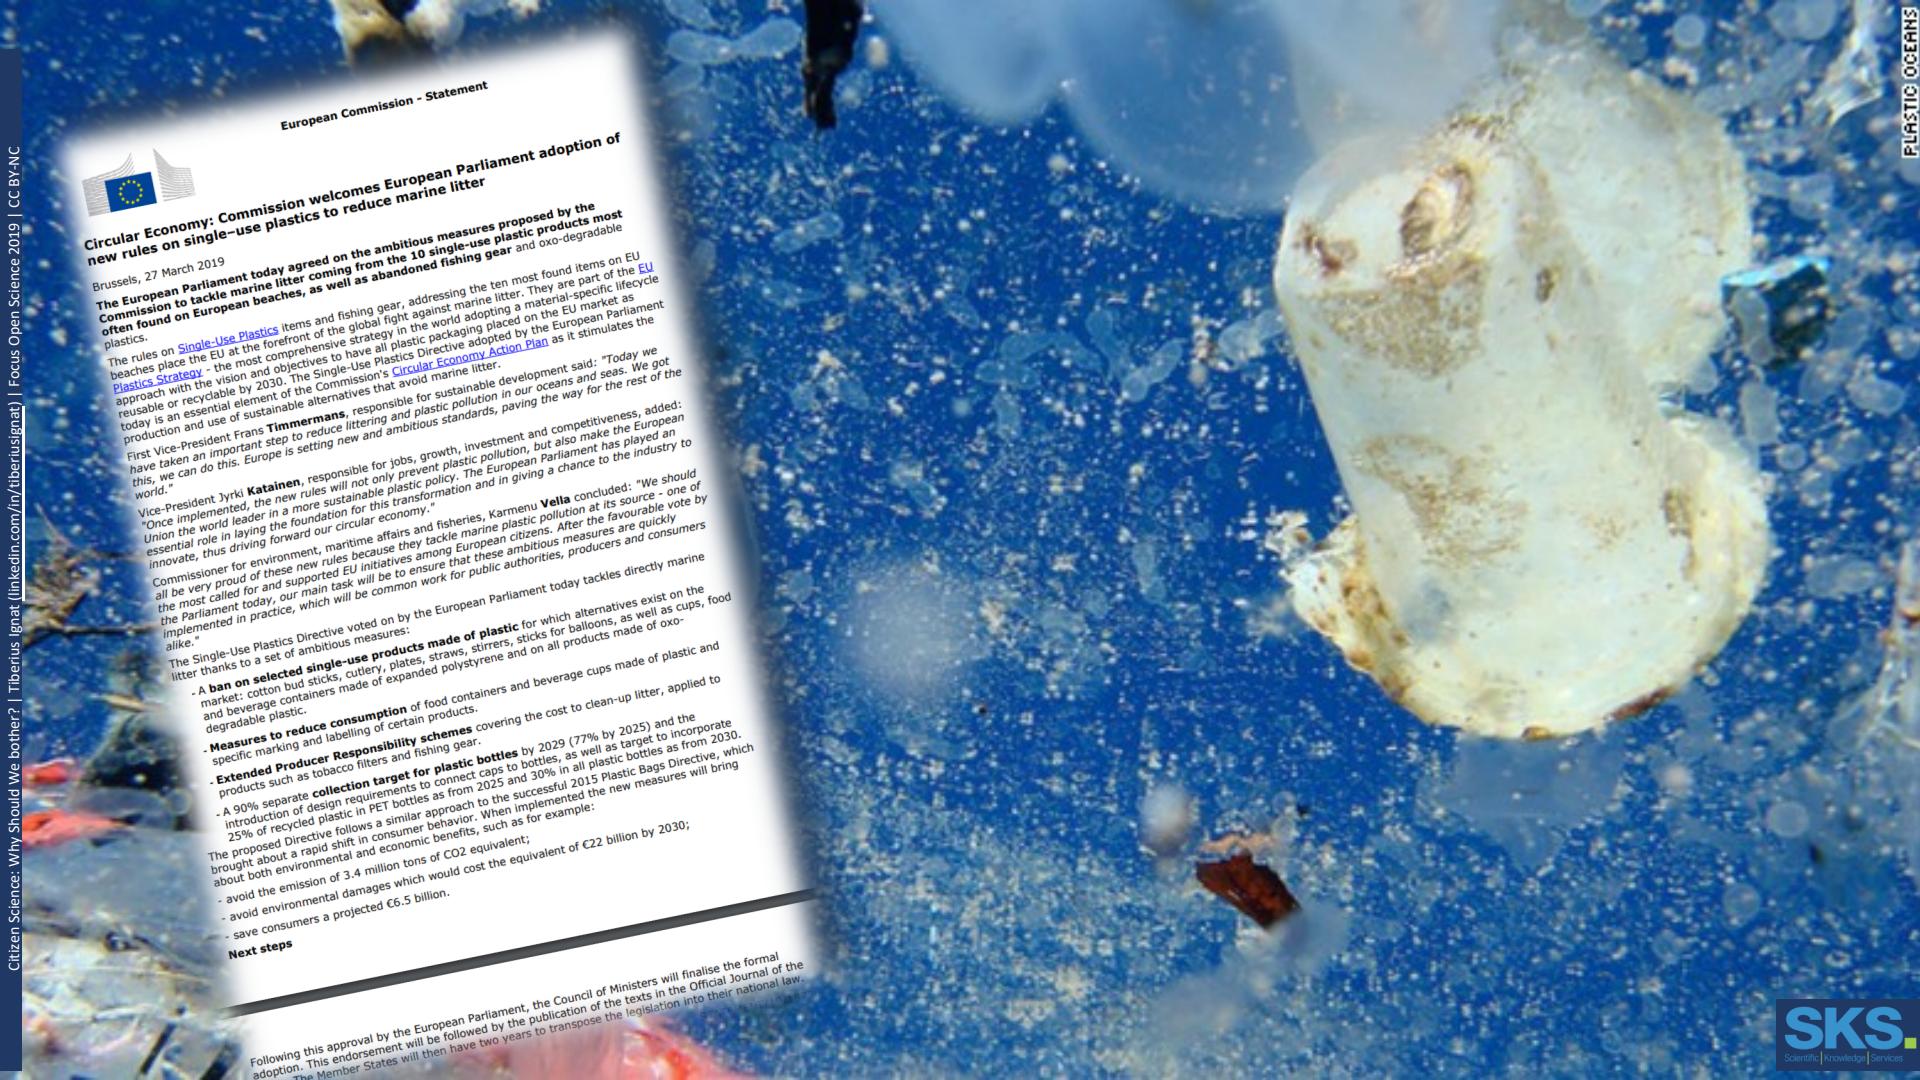

The rules on Single-use plastics at the European level are the most comprehensive approach with the vision and objectives to have all plastic products either reusable or recyclable by 2030. The Single-Use Plastics Directive today is an essential element of the Commission's Circular Economy Action Plan. First Vice-President Frans Timmermans, responsible for sustainable development said: "Today we have taken an important step to reduce littering and plastic pollution in our oceans and seas. We got this, we can do this. Europe is setting new and ambitious standards, paving the way for the rest of the world." Vice-President Jyrki Katainen, responsible for jobs, growth, investment and competitiveness, added: "Once implemented, the new rules will not only prevent plastic pollution, but also make the European Union the world leader in a more sustainable plastic policy. The European Parliament has played an important role in laying the foundation for this transformation and in giving a chance to the industry to move forward our circular economy."

The Single-Use Plastics Directive voted on by the European Parliament today tackles directly marine litter thanks to a set of ambitious measures:
on selected single-use products made of plastic for which alternatives exist on the market: sticks, cutlery, plates, straws, stirrers, sticks for balloons, as well as cups, food containers of expanded polystyrene and on all products made of oxo-
degradable plastic such as beverage cups made of plastic and used to

- **Single-Use Plastics Directive** voted on by European Parliament last year thanks to a set of ambitious measures:
 - **a ban on selected single-use products made of plastic** for alternatives exist on the market: cotton bud sticks, cutlery, plates, straws, stirrers, sticks for balloons, as well as cups, food and beverage containers made of expanded polystyrene and all products made of oxo-degradable plastic.
 - **Measures to reduce consumption** of food containers and beverage cups made of plastic and specific marking and labelling of certain products.
 - **Extended Producer Responsibility schemes** covering the cost to clean-up litter, applied to products such as tobacco filters and fishing gear.
 - A 90% separate **collection target for plastic bottles** by 2029 (77% by 2025) and the introduction of design requirements to connect caps to bottles, as well as target to incorporate 25% of recycled plastic in PET bottles as from 2025 and 30% in all plastic bottles as from 2030. The proposed Directive follows a similar approach to the successful 2015 Plastic Bags Directive, which brought about a rapid shift in consumer behavior. When implemented the new measures will bring about both environmental and economic benefits, such as for example:
 - avoid the emission of 3.4 million tons of CO₂ equivalent;
 - avoid environmental damages which would cost the equivalent of €22 billion by 2030; - consumers a projected €6.5 billion.

Next steps

Following this approval by the European Parliament, the Council of Ministers will finalise the formal adoption. This endorsement will be followed by the publication of the texts in the Official Journal of the European Union. The Member States will then have two years to transpose the legislation into their national law.

Emerging policies and recommendations

OSPP-REC

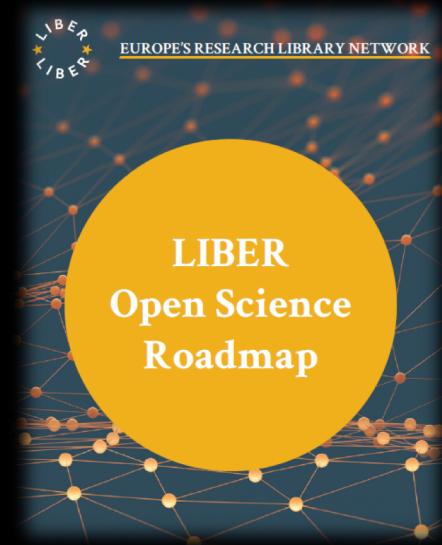

Citizen Science

Initially funded Citizen Science projects (as part of PPP projects) should actively support the uptake of Citizen Science (including open access and reuse of research outputs, data and publications).

Research performing organisations (RPOs) are encouraged to promote and enhance capacity to create a favourable environment for Citizen Science, by involving existing activities and infrastructures in the outreach of RSCs. In addition, libraries are well placed, among other things, to contribute actively to the research, education and communication of Citizen Science, as well as relevant training, fostering skills development, and the production of knowledge. Best practice management, co-production standards and social diversity, as well as funding and incentives need to be put in place to support this endeavour.

Insights – 35, 2016
Merry work: libraries and citizen science

UKSG

This article highlights important new opportunities for libraries by analysing the role they could potentially play in citizen science projects. Citizen science is one of the multiple pillars of open science identified by the European Open Science Platform, an initiative of the European Commission. The authors of the present paper argue that libraries, whether to engage in citizen science projects or not, have a role to play in supporting specific skills development and maintaining interest in citizen science communities, data forms and analysis methods, contributing to making data available and new communication models in marketing scientific findings and helping citizens participate in projects. The paper also discusses the challenges of these roles and highlights the need for further development and implementation of citizen science projects. Some of these roles are illustrated by case studies from the United Kingdom, where citizen science has already been adopted by universities and research institutions. This article thus presents a scenario of what libraries have so far achieved in this sphere and the challenges and opportunities which remain.

CITIZEN SCIENCE AND LIBRARIES: WALTZING TOWARDS A COLLABORATION

by Tiberius Ignat, Darlene Cavalier and Caroline Nickerson

Abstract: The authors of this paper present context and case studies to illuminate several current policies, recommendations, and practices from the United States and Europe in support of libraries seeking to engage with citizen science, with the goal of encouraging librarians in Europe to leverage existing citizen science resources and take inspiration from successful international examples to make their libraries hubs for citizen science.

Review Article
Paul Ayris*, Tiberius Ignat

Defining the role of libraries in the Open Science landscape: a reflection on current European practice

<https://doi.org/10.1515/opis-2018-0001>
Received October 27, 2017; accepted December 23, 2017

Abstract: This collaborative paper looks at how libraries can engage with and offer leadership in the Open Science movement. It is based on case studies and the results of an EU-funded research project on Research Data Management taken from European research-led universities and their libraries. It begins by analysing three recent trends in Science, and then links component parts of the research process to aspects of Open Science. The paper then looks in detail at four areas and identifies roles for libraries: Open Access and Open Access publishing, Research Data Management, E-Infrastructures (especially the European Open Science Cloud), and Citizen Science. The paper ends in suggesting a model for how libraries, by using a 4-step test,
